## Depth First search

Aim:

TO traverse a graph or tree starting from a node & visiting depth

Algorithm:

\* Created a Visited Set

\* Created a Stack & Push the starting node

\* mark the starting node

\* when stack is not empty

POP a node & Print the node, & push

\* terminate when stack is empty

code:

```
def dfs(graph, start)
```

```
    visited = set()
```

```
    stack = [start]
```

```
    visited.add(start)
```

```
    while stack:
```

```
        vertex = stack.pop()
```

```
        print(vertex, end=" ")
```

```
        for neighbor in reversed(graph[vertex]):
```

```
            if neighbor not in visited:
```

```
                visited.add(neighbor)
```

```
                stack.append(neighbor)
```

```
graph = {}
```

```
n = int(input("enter no of nodes"))
```

```
for i in range(n):
```

```
    node = input(f"Enter node {i+1}: ")
```

```
    neighbors = input(f"Enter neighbors of {node}: ").split()
```

```
    graph[node] = neighbors
```

```
start_node = input("Enter the starting node: ")
```

```
dfs(graph, start_node)
```

Output:

For graph

Enter number of nodes: 5

Enter node 1: a

Enter neighbors of a: b c

Enter node 2: b

Enter neighbors of b: d

Enter node 3: c

Enter neighbors of c: f

Enter node 4: d

Enter neighbors of d:

Enter node 5: f

Enter neighbors to f:

Enter starting node: a

a b d c f

Result:

that Depth first search algorithm is successfully executed & output is verified.
